

ABSTRACT

A ceiling trim comprising a plurality of trim elements and a plurality of connector clips for connecting abutting trim elements to form a continuous beam free of imperfections. Each connector clip is formed of a single elongated plate and includes first and second end sections. Each of the first and second end sections include a longitudinally extending web and a means for securing the end sections to the trim elements. The connector clip also has an intermediate section which integrally connects the first and second end sections. The intermediate section has a means for cinching together the edges of adjacent trim elements to provide a ceiling edge having a clean, finished appearance.
